

Who Regulates the Regulators?

Jared Able

Joshua Jackson

Zachary Brennan

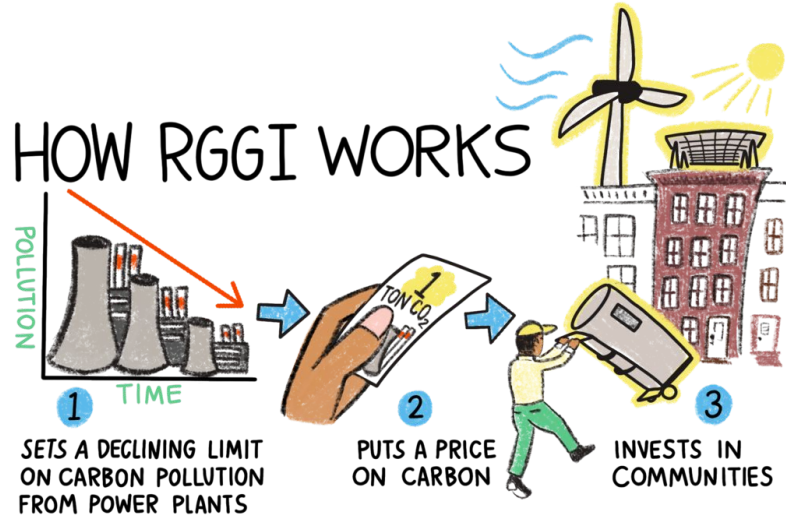

Alexandria Wheeler

Nicholas Geiser

Background

Regional Greenhouse Gas Initiative

Mandatory market-based emissions reduction

Implementation

- Implement region-wide cap-and-trade on power plant CO₂ emissions (northeastern states)
- 2009 - 2013: 188 mil ⇔ 165 mil allowances
- 2014 - 2019: 91 mil ⇔ 80 mil allowances

Our Goal

- Show effectiveness of RGGI in reducing CO₂
- Predict emissions in a world where RGGI was never implemented

Show positive potential for stakeholders through further adoption by more states

Dataset

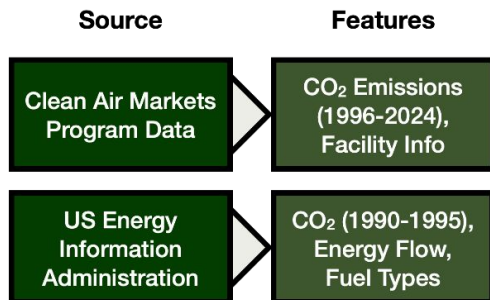

Source

Clean Air Markets
Program Data

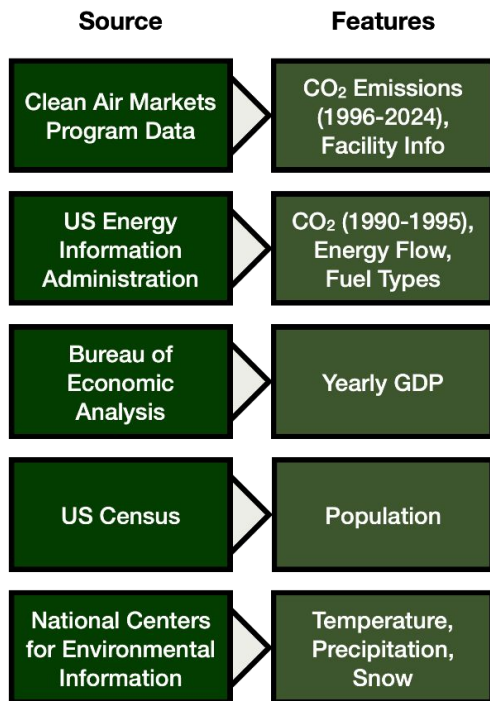

Features

CO₂ Emissions
(1996-2024),
Facility Info

Model

Synthetic Control Method:

- Goal: create synthetic control state from weighted combination of control states
- Weights chosen to minimize
 $\text{Gap} = \text{Synthetic} - \text{Treated}$
during pre-intervention period
- Gaps in post-intervention period then used to evaluate intervention effect

Model

MA Emissions: Actual vs. Synthetic Control

Final Model:

- Model: Augmented Synthetic Control
- Variable of Interest: CO2 emissions per capita
- Intervention date: 2009-01-01
- Donor Pool: 33 (non-RGGI) states

Variables	Real MA	Synthetic MA
Snow	1.035	0.973
% of Energy Produced from Coal	0.258	0.339
CO2 per capita	-1.213	-1.239

Results

Initial Hypothesis Test

• **79% CO2 Reduction**

Placebo Test

• $r^2 = .26$

• $p = .03$

Results

Initial Hypothesis Test

• **79% CO2 Reduction**

• $r^2 = .26$

• $p = .03$

Placebo Test

Gap Plot: Treated vs. Placebos

Results

Second Hypothesis Test

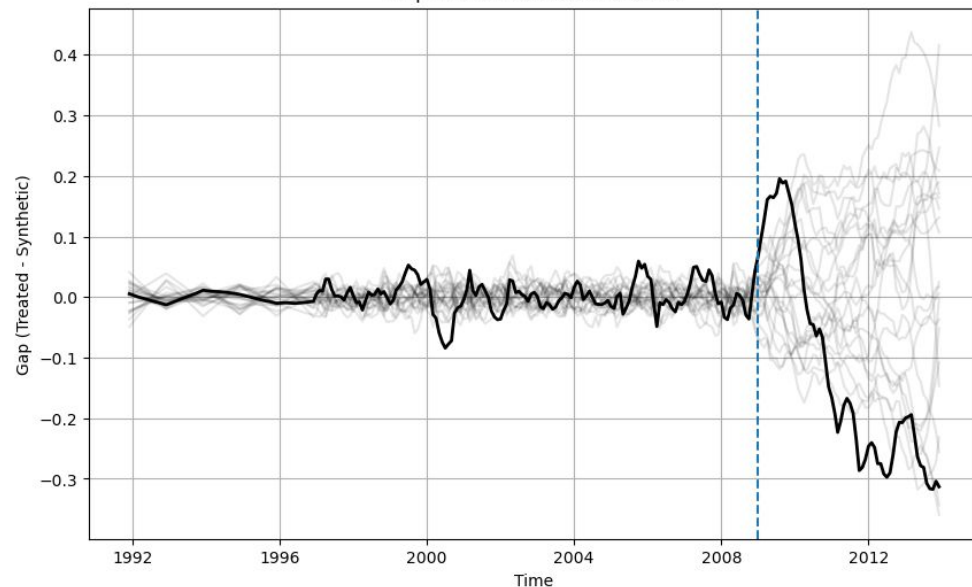

• **0.4% CO2 Reduction**

• $r^2 = .91$

• $p = .18$

Placebo Test

Gap Plot: Treated vs. Placebos

A photograph of a nuclear power plant with several large, white, hyperboloid cooling towers emitting plumes of white steam. The plant is situated in a green field under a blue sky with scattered white clouds. In the background, there are some industrial buildings and a tall chimney.

Future Work

- Robustness checks
- Explore bias from anticipation and interference effects
- Benefit-cost analysis

A photograph of a nuclear power plant with four large, white, hyperboloid cooling towers. Two towers in the foreground are emitting thick white plumes of steam that rise into the sky. The background shows other industrial buildings, a tall chimney, and a line of trees under a blue sky with scattered white clouds.

Future Work

- Robustness Checks:
 - Placebo date test

A photograph of a nuclear power plant with four large, white, hyperboloid cooling towers. Two towers in the foreground are emitting thick white steam that rises into the sky. The plant itself is a complex of various structures, including buildings and piping, situated behind a green field. The sky is blue with scattered white clouds.

Future Work

- Robustness Checks:
 - Placebo date test
 - Leave-one-out test

A photograph of a nuclear power plant with four large, white, hyperboloid cooling towers. Two towers in the foreground are emitting thick white plumes of steam that rise into the sky. The plant itself is a complex of various structures, including buildings and piping, situated behind a green field. The sky is blue with scattered white clouds. The text "Future Work" is overlaid in white on the right side of the image.

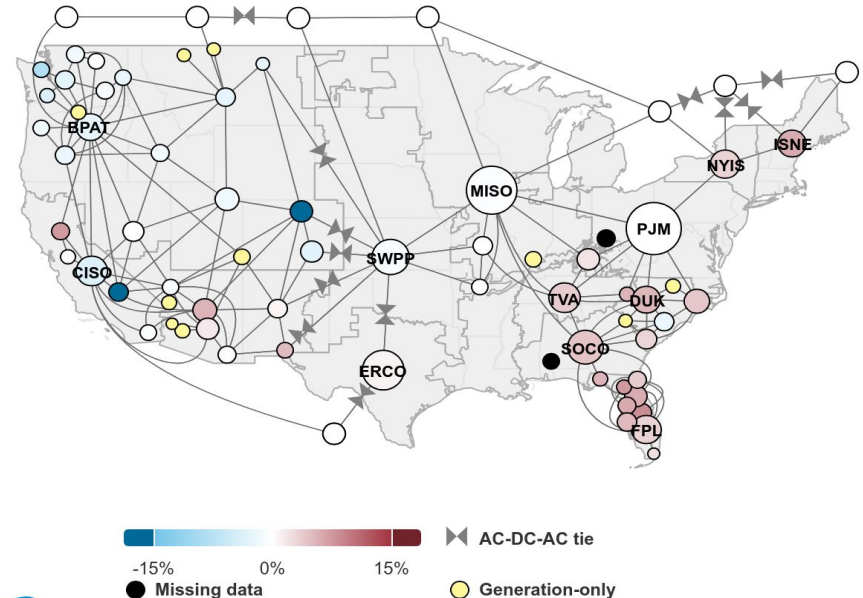

Future Work

- Potential biases:
 - Anticipation effects by power plants before RGGI auctions began.

Future Work

U.S. change in demand from prior hour as of 4/19/2025 4 p.m. EDT
(percent change)

- Potential biases:
 - Anticipation effects by power plants before RGGI auctions began.
 - Interaction effects between electricity markets inside and outside of RGGI

Future Work

- Benefit-cost analysis:
 - How cost-effective has RGGI been compared to alternatives?
